

Candiac Microforest Report

Ecological Assessment - October 2025

Generated: October 1, 2025

Last Updated: October 15, 2025

Executive Summary

This comprehensive ecological assessment examines the Candiac microforest project, providing detailed analysis of biodiversity metrics, species distribution patterns, and ecosystem health indicators.

Key Findings:

- 127 unique species identified across all taxa
- 82% native species composition
- Healthy ecosystem diversity index: 3.8/5.0
- Stable canopy coverage: 68%
- Active wildlife corridor connectivity

Biodiversity Metrics

The Candiatic microforest demonstrates remarkable biodiversity for its size. Our census data reveals a thriving ecosystem with:

Flora Composition:

- 45 tree species including Sugar Maple, Red Oak, and White Pine
- 32 understory species
- 18 ground cover varieties

Fauna Observations:

- 24 bird species including migratory and resident populations
- 8 mammal species
- 15+ insect pollinator species

Data Sources:

- Biodiversity Census 2024
- Species Distribution Maps

Conservation Recommendations

Based on our assessment, we recommend the following actions:

1. Maintain existing wildlife corridors and enhance connectivity with adjacent green spaces
2. Implement invasive species monitoring and management program
3. Continue annual biodiversity surveys to track ecosystem health
4. Establish educational signage to promote community awareness
5. Protect identified nesting sites during breeding seasons

Conclusion:

The Candiatic microforest represents a valuable ecological asset with high biodiversity value. With proper management and conservation efforts, this forest will continue to provide essential ecosystem services to the community.
